AI Lead Research and Outreach Automation

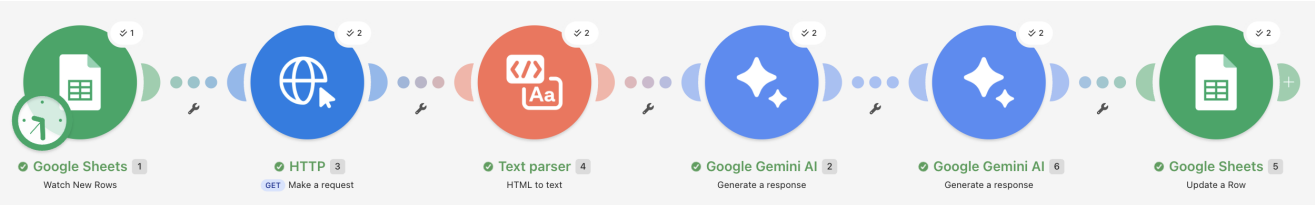

Project showcase by Ankitha Suttoju | Built with Make, Google Sheets and the Gemini API

Problem

Researching B2B prospects and writing personalised outreach by hand is slow and repetitive. I built a workflow that does the first draft automatically, so a person can review and send.

What I built

A six-step Make scenario: it reads a company name and website from Google Sheets, fetches the site, converts it to plain text, and uses Gemini twice, first to write a company summary, a fit assessment and a suggested decision-maker role, then to draft a short outreach email. The results are written back to the sheet. Tested on 5 B2B software companies.

Make scenario: Google Sheets (Watch New Rows) → HTTP (Make a request) → Text parser (HTML to text) → Gemini (research) → Gemini (email draft) → Google Sheets (Update a Row).

Output in Google Sheets: company summary, why they fit, suggested contact role, and an email draft for each company. Email text is cut off by the column width.

What I learned and improved

- Prompts: my first prompt made the AI write “not sure” for judgement questions. I separated facts (from the website only) from judgement (best estimate).
- Quality: I added company-size rules so contact roles fit small firms, and banned placeholders like [Name] and unsupported claims in emails.
- Reliability: I hit free-tier rate and daily limits and a timeout, and handled them by shortening the website text, limiting batch size and switching models.
- Spreadsheet: I had the AI return one line and used Google Sheets formulas to split it into columns.
